1 Introduction

In this paper, we will replicate the results from "Civic Honesty Around the Globe" (Cohn et al. 2019). Anything I call an "extra challenge" is available for the intrepid among you, but is not required.

To submit your final exam, knit this `.Rmd` to a PDF and post it to eLC.

2 Data

Replication files are available here, and I have already downloaded them into the `data/` folder. Let's load the behavioral data.

```
data <- read_csv('data/behavioral data (csv file).csv')
```

3 Results

3.1 Replicating Figure 1

First, let's replicate the left-hand side of Figure 1. To do so, we need to perform the following steps:

- Keep only the `Money` and `NoMoney` conditions.

- Recode the `cond` variable as "Money" and "NoMoney".
- Compute the average response rate, grouped by country and condition.
- Plot a scatter with reporting rate on the x-axis, country on the y-axis, and colored by monetary condition.

As an extra challenge, you can:

- Rearrange the y-axis so that the countries with the lowest reporting rate appear at the bottom and those with the highest reporting rate appear at the top.
- Include the line segments between points from the original figure
- Use the colors from the original figure

```
fig1 <- data %>%
  filter(cond %in% c(0,1)) %>%
  mutate(cond = case_when(cond == 1 ~ 'Money',
                          cond == 0 ~ 'NoMoney')) %>%
  # compute reporting rate by country and monetary condition
  group_by(Country,
           cond) %>%
  summarize(pct_reported = mean(response)) %>%
  # # sort by reporting rate
  # ungroup %>%
  # arrange(pct_reported) %>%
  # mutate(Country = factor(Country, levels = unique(Country))) %>%
  # plot
  ggplot() +
  geom_point(aes(x=pct_reported, y=Country, color = factor(cond))) +
  labs(x = 'Reporting rate (%)', y = '', color = 'Condition') +
  theme_minimal()

fig1
```

```
# Here's the challenging one
fig1a <- data %>%
  filter(cond %in% c(0,1)) %>%
  mutate(cond = case_when(cond == 1 ~ 'Money',
                          cond == 0 ~ 'NoMoney')) %>%
  # compute reporting rate by country and monetary condition
  group_by(Country,
```

```
            cond) %>%
  summarize(pct_reported = mean(response)) %>%
  # pivot_wider to make those line segments
  ungroup %>%
  pivot_wider(names_from = cond, values_from = pct_reported) %>%
  # sort by NoMoney reporting rate
  arrange(NoMoney) %>%
  mutate(Country = factor(Country, levels = unique(Country))) %>%
  ggplot() +
  geom_segment(aes(x=Money, xend=NoMoney, y=Country, yend=Country),
               color = 'gray', size = 0.5) +
  geom_point(aes(x=Money,y=Country), color = 'red') +
  geom_point(aes(x=NoMoney,y=Country), color = '#F6BE00') +
  geom_text(aes(x=NoMoney-3, y=Country, label = Country), size = 2) +
  labs(x = 'Reporting rate (%)', y = '', color = 'Condition') +
  theme_classic() +
  theme(axis.text.y = element_blank(),
        axis.ticks.y = element_blank())

fig1a
```
